## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 8\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotException  
AtTheRateException  
DomainException

A typical email address should have a "." character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

### ***Input Format***

The first line of input contains the email to be validated.

### ***Output Format***

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

### **Sample Test Case**

Input: sample@gmail.com

Output: Valid email address

### **Answer**

```
import java.util.*;
class DotException extends Exception{
    DotException(String msg){
        super(msg);
    }
}
class AtTheRateException extends Exception{
    AtTheRateException(String msg){
        super(msg);
    }
}
class DomainException extends Exception{
    DomainException(String msg)
    {
        super(msg);
    }
}
public class Main{
    public static void main(String args[])
    {
        Scanner scan=new Scanner(System.in);
        String email=scan.nextLine();
        try{
            validateEmail(email);
            System.out.println("Valid email address");
        }
        catch(DotException e){
            System.out.println("DotException: "+e.getMessage());
            System.out.println("Invalid email address");
        }
        catch(AtTheRateException e){
            System.out.println("AtTheRateException: "+e.getMessage());
        }
    }
}
```

```

        System.out.println("Invalid email address");
    }
    catch(DomainException e){
        System.out.println("DomainException: "+e.getMessage());
        System.out.println("Invalid email address");
    }
}

public static void validateEmail(String email) throws
DotException,AtTheRateException,DomainException
{
    int atcount=email.length()-email.replace("@","").length();
    if(atcount!=1 || email.startsWith("@") ||email.endsWith("@") ||
email.contains("@@")){
        throw new AtTheRateException("Invalid @ usage");
    }
    if(email.startsWith(".")||email.endsWith(".")||email.contains(".."))
    {
        throw new DotException("Invalid Dot Usage");
    }

    if(!(email.endsWith("in")||email.endsWith("com")||email.endsWith("net")||
email.endsWith("biz")))
    {
        throw new DomainException("Invalid Domain");
    }
}
}
}

```

**Status : Correct**
